1. PROBLEM STATEMENT

Tactical decisions rely heavily on subjective intuition.

Existing models focus on outcome prediction, not tactical guidance.

Most systems depend on team identity or rankings.

RK	Team	Total Points	Previous Points	+/-	Positions
1	Belgium	1832.33	1822.34	9.99	
2	Brazil	1811.73	1797.67	14.06	
3	England	1755.44	1752.83	2.61	▲
4	France	1754.31	1761.77	-7.46	▼
5	Italy	1735.73	1744.67	-8.94	
6	Argentina	1725.31	1714.43	10.88	
7	Portugal	1674.9	1661.51	13.39	▲
8	Spain	1673.68	1680.44	-6.76	▼

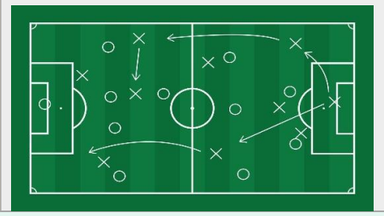
2. TARGET MARKET

Football Analysts and Coaching Staff seeking opponent-specific strategies.

Sports analytics researchers and data science students.

3. SOLUTION OVERVIEW

Sim2Win is a system that analyzes based on historical data of a team its tactical configuration and estimates what is the best configuration to play against that team.



4. UNIQUE VALUE PROPOSITION

Team-Agnostic Generalization: Unlike other models, it does not rely on team names, results or rankings, allowing it to work for teams not present in the training data.

Actionable Recommendations: Reframes the problem from simple *prediction* to *tactical recommendation*, directly assisting decision-making.

Interpretability: Provides explainable insights based on event-based data rather than "black box" team ratings like Elo or Pi-Rating.

5. Technology Stack

Pandas, NumPy, SciPy, scikit learn, PyTorch, Streamlit

6. KEY ACTIVITIES

Data Processing: Aggregating multi-league data and cleaning it alongside feature engineering to create some features needed.

Modeling: Engineering tactical playstyle vectors and training probabilistic models linking tactics to outcomes.

Simulation Engine: Developing the mechanism to test various tactical configurations against specific opponents.

Validation: Evaluating performance using a "Tactical Agreement Score" on unseen teams.

7. CHALLENGES AND RISKS

Noisy Recommendations: Tactical suggestions may contain statistical noise.

Data Sparsity: Potential difficulties in generating profiles for new teams with limited history.

Causal Interpretation: Risk of users misinterpreting correlations as direct causation.

Mitigation: Feature validation, Feature importance testing, and clear framing of the tool as a decision-support aid not a decision maker.

8. REVENUE STREAMS

Licensing: Software licensing to professional football clubs and academies.

SaaS (Software as a Service) Model: Subscription access for freelance analysts and smaller coaching staffs.

Integration Fees: B2B (Business to Business) services for integrating the recommendation engine into existing sports data platforms.

9. COST STRUCTURE

Development: Engineering time for coding, model tuning, and UI development.

Computational Resources: Cloud computing costs for training complex ML models on large datasets.

Data Acquisition: Costs associated with maintaining high-quality, event-based match data streams.

10. IMPACT GOALS

Operational: Bridge the gap between predictive modeling and decision support.

Tactical: Assist coaching staff in preparing opponent-specific

Academic: Demonstrate that generalizable modeling is possible.
